**Department:** Computer Engineering

**Division:** C (C1)

**Course:** Data Structures Laboratory

**Course Code:** BCE23PC02

**Date:**

## Assignment – 9A

- **Aim:**

Implement a restaurant waitlist system using the queue data structure. Restaurant waitlist provide following facility:

- a. Add Party to Waitlist
- b. Seat Party
- c. Display Waitlist

- **Source Code :**

```
#include <iostream>
#include <string>
using namespace std;
```

```
class Queue {
public:
    int front;
    int rear;
    string arr[5];
```

```
Queue() {
    front = -1;
    rear = -1;
}
```

```
void addParty(string partyName) {
    if (rear == 5 - 1) {
        cout << "Waitlist is FULL: Party " << partyName << " cannot be added." << endl;
    } else {
        if (front == -1) {
```

```

        front = 0;
    }
    rear++;
    arr[rear] = partyName;
    cout << "Party " << partyName << " added to the waitlist." << endl;
}
}

string seatParty() {
    if (front == -1 || front > rear) {
        cout << "Waitlist is empty." << endl;
        return "";
    }
    string partyName = arr[front];
    front++;

    if (front > rear) {
        front = rear = -1;
    }
    return partyName;
}

void displayWaitlist() {
    if (front == -1 || front > rear) {
        cout << "Waitlist is empty." << endl;
        return;
    }
    cout << "Current Waitlist: ";
    for (int i = front; i <= rear; i++) {
        cout << arr[i] << " ";
    }
    cout << endl;
}

};

int main() {
    Queue waitlist;
    int choice;
    string partyName;

    do {

```

```
cout << "Restaurant Waitlist System Menu:" << endl;
cout << "1. Add Party to Waitlist" << endl;
cout << "2. Seat Party" << endl;
cout << "3. Display Waitlist" << endl;
cout << "4. Exit" << endl;
cout << "Enter your choice (1-4): ";
cin >> choice;

switch (choice) {
    case 1:
        cout << "Enter party name: ";
        cin >> partyName;
        waitlist.addParty(partyName);
        break;

    case 2:
        partyName = waitlist.seatParty();
        if (!partyName.empty()) {
            cout << "Seated Party: " << partyName << endl;
        }
        break;

    case 3:
        waitlist.displayWaitlist();
        break;

    case 4:
        cout << "Exiting the program." << endl;
        break;

    default:
        cout << "Invalid choice. Please enter a number between 1 and 4." << endl;
        break;
}
} while (choice != 4);
return 0;
}
```

- Screen Shot of Output :

Output Clear

```
Restaurant Waitlist System Menu:
1. Add Party to Waitlist
2. Seat Party
3. Display Waitlist
4. Exit
Enter your choice (1-4): 1
Enter party name: PartyA
Party PartyA added to the waitlist.
Restaurant Waitlist System Menu:
1. Add Party to Waitlist
2. Seat Party
3. Display Waitlist
4. Exit
Enter your choice (1-4): 1
Enter party name: partyB
Party partyB added to the waitlist.
Restaurant Waitlist System Menu:
1. Add Party to Waitlist
2. Seat Party
3. Display Waitlist
4. Exit
Enter your choice (1-4): 2
Seated Party: PartyA
Restaurant Waitlist System Menu:
1. Add Party to Waitlist
2. Seat Party
3. Display Waitlist
4. Exit
Enter your choice (1-4): 3
Current Waitlist: partyB
Restaurant Waitlist System Menu:
1. Add Party to Waitlist
2. Seat Party
3. Display Waitlist
4. Exit
Enter your choice (1-4): 4
Exiting the program.

=== Code Execution Successful ===
```

- **Conclusion:**

In this assignment, we implemented a restaurant waitlist system using arrays to demonstrate queue operations for adding parties, seating them, and displaying the current waitlist. The program effectively handles basic queue functionalities while providing a user-friendly menu interface.
